

Carbon Places Kit

Reusable infrastructure for place-based carbon and ecosystem information

Turning complex carbon-relevant geodata into understandable, reusable and traceable local information.

OPEN-SOURCE • CARBON-RELEVANT • AREA-FIRST

Carbon is discussed in numbers. Places ask concrete questions.

Forests, wetlands and restoration sites turn carbon data into local questions.

Open environmental data is abundant. Local understanding is not.

The missing layer is between open data and local understanding.

What if place became the translation layer?

Start where carbon becomes tangible.

Forests

Wetlands

Restoration sites

**Make carbon-relevant context understandable.
Keep claims grounded in the evidence.**

Not another carbon dashboard. A reusable foundation.

Every result keeps its evidence and limits.

EVIDENCE

Source

Date

Method

Limits

**Local records stay
under local control.**

Publish by choice.

Make information reusable without losing its evidence.

One shared capability. Three forms of public value.

A concept today. Real-data integration comes next.

01

Concept exploration

Make the concept visible and testable.

02

Real-data module

One dataset. One real area. Verified outputs.

03

Integration pilot

Test reuse in an existing workflow.

Make carbon-relevant open data useful where it matters.

**Carbon-relevant ecosystems.
Real places.
Shared capability.**
